Addition of Interactive Element – Simplified Punch Card Simulator

Changes Made:	• Added a new interactive element for the 1940s–1950s era called the Simplified Punch Card Simulator. • Included a text input field where users can enter a short word or number. • Added a digital punch card visualization that dynamically displays hole patterns based on user input. • Implemented a simplified encoding model to demonstrate how early computers stored data using punch cards. • Added a sample interface layout to illustrate the proposed design and user interaction flow of the simulator.
Reason for Revision:	• To provide a hands-on demonstration of one of the earliest forms of computer input and data storage. • To strengthen the exhibit's representation of the evolution of Human-Computer Interaction by including an interaction method from the punch card era. • To better communicate the intended appearance and functionality of the simulator.
Impact on Project:	• Enhances user engagement through interactive learning. • Provides a visual representation of early data encoding techniques. • Improves the clarity of the proposal by including a sample layout of the interactive element. • Creates a more complete historical progression from punch cards to command-line, graphical, and voice-based interfaces.
